

Computer Decommissioning Policy

Managed Service Provider (MSP) - Bastionpoint Technology

1. Purpose

This policy outlines the procedures for decommissioning software and client data from computing devices managed by Bastionpoint Technology. It ensures the secure removal, storage, or disposal of data and software in compliance with legal, regulatory, and contractual obligations.

2. Scope

This policy applies to all computing devices, including desktops, laptops, servers, and network-attached storage, that are managed and supported by Bastionpoint. It includes data handling for both internal and client-owned assets.

3. Decommissioning Procedure

3.1 Client Notification & Request Confirmation

- Prior to decommissioning, Bastionpoint will notify the client and confirm the handling of data and software. The client must specify whether they want data stored, securely deleted, or transferred.
- A formal request and authorization must be obtained from the client, documented via ticketing systems or signed agreements.

3.2 Client Options for Decommissioning

If the machine is under warranty (or within 3 years of age), the client has two options:

1. **Keep the machine on-site:** The client may retain the machine for future redeployment at their leisure while continuing to pay the monthly management fee for the device.
2. **Bastionpoint Secure Storage:** The client may opt to have Bastionpoint store the device for **free** in a secure, logged environment. The device will be freshly installed and prepared for its next deployment with no company data attached. In this case, the monthly management fee for the device will be removed.

- **Limitation of Liability:** Bastionpoint assumes no liability for loss, damage, theft, or unforeseen circumstances (including but not limited to natural disasters, acts of God, or third-party actions) while the device is stored on Bastionpoint property. The client acknowledges and accepts these terms upon selecting this storage option.

If the machine is out of warranty (older than 3 years):

- The machine will be fully decommissioned.
- All data will be securely removed.
- The hardware will be responsibly e-cycled.

3.3 Internal Workflow for Device Decommissioning

1. Device Return & Secure Storage:

- The device is returned to the offices of **Bastionpoint Technology** for decommissioning and is stored in a designated **Secure Decom Area**.

2. Client Confirmation & Action Selection:

- Bastionpoint will contact the client's **Point of Contact (POC)** to confirm the preferred action for the device and if any data needs to be backed up, it will include a copy of this policy.

a. **Reimage & Redeployment:** The device is reimaged and sent back to the client site for reuse.

b. **Secure Storage for Future Redeployment:** The device is securely stored at Bastionpoint until the client requests redeployment.

c. **Secure Destruction & E-Cycling:** All drives are securely wiped to Department of Defense specifications, or destroyed, with the remaining hardware responsibly e-cycled. **(The client must complete a formal authorization form before destruction.)**

d. Notification: Client will be notified of destruction, and a certificate of destruction will be provided if requested.

3. Execution of Client-Selected Action:

- Once the client provides formal authorization, the device will be processed following the **Decom Checklist** and the **Computer Decommissioning Policy** outlined here by Bastionpoint Technology.

3.4 Data Backup & Retention (If requested.)

- If the client requests data retention, data will be securely backed up to an MSP-managed storage system. The cost will be **\$100 per terabyte per month** for cold storage.
- The retention period will follow the client's data policy or regulatory requirements (e.g., GDPR, HIPAA, or industry-specific mandates).
- Encrypted backups will be stored in a secure data repository with restricted access.

3.5 Secure Data Removal

If the client requests data deletion:

- **Data Overwriting:** All drives are securely wiped to Department of Defense specifications.
- **Physical Destruction:** If required, storage devices will be physically destroyed via shredding or degaussing. Non-data storage devices will be donated to **Tech For Troops** or a similar non-profit organization.
- Upon completion, the client will receive a certificate of data destruction if requested. **(Additional \$50 charge may apply for certificate of destruction.)**

3.6 Software License & Application Removal

- All licensed software will be deactivated and uninstalled according to vendor agreements and licensing compliance.
- Proprietary applications will be removed following client instructions.

- Open-source or freeware software may be retained or deleted as per MSP policy.

3.7 Hardware Disposal or Reuse

- If hardware is to be repurposed or reassigned, a full system wipe will be performed.
- If the client opts for disposal, Bastionpoint will follow environmentally compliant e-waste disposal practices via donation to **Tech For Troops or another similar Non-profit**.
- A certificate of destruction will be provided if required at a cost of **\$50 per device**.

4. Compliance & Auditability

- All decommissioning actions will be logged into Bastionpoint's ticketing system.
- Regular audits will be conducted to ensure adherence to the decommissioning policy.
- Compliance with relevant data protection regulations (e.g., GDPR, HIPAA, CCPA) will be maintained at all times.

5. Roles & Responsibilities

- **MSP Technicians:** Perform decommissioning procedures and ensure secure handling of client data.
- **MSP Officers:** Review and audit decommissioning logs to verify regulatory compliance.
- **Client IT Representative:** Provides instructions on data retention or deletion and confirms completion of decommissioning.
- **Secure Storage Manager:** Oversees secure storage and processing of decommissioned devices, contacts clients for authorization, and ensures proper execution of decommissioning actions.

6. Policy Review & Updates

This policy will be reviewed annually or as required to align with evolving security standards, client agreements, and regulatory changes.
